# Resources: The windy rural areas

areas

# Expanding transmission planning: Grid-wide

**WECC** Western Electricity Coordinating Council

**Scenario Planning Steering Group (SPSG)**

The purpose of SPSG is to provide strategic guidance to the Transmission Expansion Planning Policy Committee (TEPPC) on (7) questions to be studied in transmission planning studies. (2) key modeling tools to be used, and (3) key assumptions to be used in creating and running the scenarios.

The scenarios created and/or recommended by the SPSG will assist TEPPC in its evaluation of long-term regional transmission capacity needs in the Western Interconnection by providing a comprehensive set of plausible future load, resource, and policy studies. The scenarios and subsequent analysis will form a comprehensive package of infrastructure-related, regional planning inputs, data, and information plans for the Western Interconnection.

The SPSG activities are part of the U.S. Department of Energy's Grid 2030 Regional Transmission Expansion Planning (RTEP) project.

There are currently no active announcements.

Member	Organization	SPSG Position
Steve Anderson	California Energy Commission	Chair/Offical
Jim Buhl	The Van Nuys Electric	Technology Advisor
Craig Cox	Arizona Energy Alliance	Technology Advisor
John Cappers	PG&E Inc.	WECC Board Member
Franka Egan	San Williams Electric	Lead Project Advisor
Steve Elmslie	Planning Energy Office	Staff/Offical
James Fisher	State of Idaho	TEPPC Liaison
Steve Frenzel	Western Office of Consumer Advocate	Consumer Advisor
Gary Orland	Western Electric Advisors	WECC Advisor

# Expanding transmission planning: Statewide

- Colorado PUC Dockets:
- 09R-904E (Noise, EMF, etc.)
- 09M-616E (rulemaking)
- Southern Colorado Transmission Project (aka San Luis Valley-Calumet-Comanche Transmission Project, Dockets 09A-324/5E).
  - The difficulties in this docket are illustrating how the lack of comprehensive, coordinated planning has helped enable NIMBY

# Western Wind and Solar Integration Study: Feasibility

“WWSIS finds that 35% renewable energy penetration is operationally feasible provided significant changes to current operating practice are made, including balancing area cooperation and sub-hourly economic dispatch.”

# Western Wind and Solar Integration Study: Cost Benefits

- “The 30% case reduced annual operating costs by 40% or \$20 billion (\$17 billion in 2009\$) and CO<sub>2</sub> emissions by 25% across WECC, assuming \$9.50/MBTU gas. At a \$3.50/MBTU gas price, operating costs were reduced by 25% and CO<sub>2</sub> by 45%.”

# Western Wind and Solar Integration Study: Demand Response and Storage

- “It is more cost-effective to have demand response address the 89 hours of contingency reserve shortfalls rather than increase spin for 8760 hours of the year. Demand response can save up to \$600M/yr (\$510M/yr in 2009\$) in operating costs versus committing additional spinning reserves.”
- “Increased renewable energy penetration slightly increases use of existing storage, but additional storage was not found to be needed.”

# Transmission decisions: Gaining public support

- **Public understanding and support**
  - Saving money on generation costs justifies transmission
  - Even though transmission dollars are large, they are tiny compared with generation costs and potential savings
  - Economic development opportunities are quantifiable, and significant
  - Transmission is still controversial, so earning stakeholder consent helps minimize controversies and overcome opposition

# Policy issues for consideration

- What does all this mean?
  - There is a great appetite for large-scale renewable energy development
  - This means changes across planning, investment and operations
  - There will be new market structures that will present challenges and opportunities
  - Member-owners' and stakeholders' consent must be earned by Tri-States
  - Tri-State member-owners can benefit from the transition to renewables

# Transmission and Resource Planning

- FERC requires the Transmission and Resource Acquisition utility functions be separated within a utility with regard to specific resource acquisitions, but that separation is not applicable to integrated load and resource planning.
  - No barrier to consideration of transmission planning and inputs process.
- Transmission planning is resource planning

# Colorado Independent Energy Association

- IPP's make up CIEA
  - IPP's need certainty in business planning
  - IPP's have proven track-record of providing cost-effective (least cost) resources when competitive bidding is enabled
- CIEA supports Tri-State's effort to improve the competitive acquisition of independent power production

# Important Modeling Assumptions

- Neutrality as between self-build and IPP resource selection
- Transmission assumptions - Integration issues were once focused on hydropower, but now focus on wind, solar and geothermal power production – the Generation Development Areas
  - Build-out costs not attributable to selected resources
  - Inputs – allow opportunity for review/response
    - Voltage levels
    - Capacity levels
    - Cost per mile
    - Constraints and network upgrades
    - Costs of operation
    - Treat all lines as in-service by the end of the RAP

# Tri-State Renewable Integration

- Wind and solar are relatively new to the Tri-State system:
  - Tri-State’s resource planning process should model different levels of renewable penetration and at least one case that involves wind off-system sales.
- Renewable resource integration studies at different penetration levels.
  - This process should be of assistance.
  - Information gathering for 2012 process.

# Cooperation and Integration

- Coordination with WAPA
  - Participation in the TIP program
- Coordination with PSCo and Black Hills
  - Missile Site Project
  - Lamar-Front Range Project
- Concerns applicable to Tri-State's modeling:
  - Looking at the system as an “island” without modeling neighboring transmission systems may skew results
  - Assigning costs of transmission to particular resources or resource areas may skew results because those costs may not represent delivered price of power

# Requested Scenarios

- Tri-State reference case should include build-out of the transmission system
  - Lamar – Front Range Project
  - SLV Project
  - NE Colorado Projects mentioned in FERC 890 Presentation
- Export scenario – keep rates low
  - Basin Electric purchases reversed through advantageous use of Tri-State's service area
  - High Plains Express participation

# Resource Acquisition

- Allow model assumptions and results relating to transmission and integration to be made known to bidders to ensure transparency
- Allow flexibility in bid formula – especially if projects are not needed until the far end of the study period
- Create a review where transmission costs are not assigned to bid after submission – allow the LGIP process to assign system upgrade costs
- Resolve RFP questions early and provide a mechanism for dispute resolution

# Summary of Recommendations for Tri-State resource models

- All scenarios - should assume transmission build out to generation development areas
- One scenario should investigate export opportunities to the east (Basin) and south (HPX)
- Provide detail to IPP's on transmission inputs to be evaluated in resource acquisition – allow CIEA to respond to initial model runs with revised transmission inputs including ATC and cost per mile
- Allow process to be divorced from transmission system upgrades so as to maximize efficient wind and solar resources
